End of Report

1 EXECUTIVE SUMMARY

The City of Meriden Board of Education has requested a detailed assessment of the mechanical systems ventilation performance in accordance with new regulations set forth by the State of Connecticut. In 2023, the state of Connecticut codified ventilation assessment at each school building under jurisdiction of local and regional boards of education. Per substitute Senate Bill 1198, "each local and regional board of education shall ensure that its heating, ventilation and air conditioning (HVAC) system is maintained and operated in accordance with the prevailing maintenance standards, such as ASHRAE Standard 62 at the time of installation or renovation of such system". These assessments must be completed by January 1, 2025, and every five years thereafter.

This report is an overview of findings from the HVAC systems evaluation performed at Thomas Hooker Elementary School. The focus of this report is twofold: First, to identify to what extent the school's current ventilation system components are operational. Second, to evaluate if the system components are operating in such a manner as to provide adequate ventilation to the spaces within the building in accordance with the most recent indoor ventilation standards.

While the school utilizes dedicated classroom unit ventilators and exhaust fans, our findings indicate that the primary source of ventilation in the school is from operable windows. Although the building code allows for ventilation to enter occupied spaces naturally through operable windows, it is not a realistic option during cold weather or hot weather months. Windows will typically be closed during those times, preventing the spaces from being properly ventilated. For this reason, operable windows will not be considered as a reliable source of ventilation in this analysis.

For this reason, it has been identified that nearly all rooms within Thomas Hooker Elementary school fail to meet the outside air requirements prescribed by the ASHRAE Standard 62, as referenced in the state's building code. We recommend soliciting an engineered design to provide consistent ventilation to the affected areas.

1.1 Building Overview

Thomas Hooker Elementary School is a two-story, 43,000 SF building located at 70 Overlook Road, Meriden, CT 06450. It was built in 1962 and had a roof renovation in 2005.

The building's ventilation and exhaust systems consist of one Unit Ventilator (UV) in each classroom for a total of twenty-six (26) UVs, two (2) heating and ventilating units (H&V) serving the Gym/Auditorium, fourteen (14) Exhaust Fans (EFs), and twenty-four (24) Fan Coil Units (FCUs).

Control of the HVAC systems is provided via pneumatic controls. The building is not equipped with a Building Automation System (BAS), or Demand-Controlled Ventilation (DCV).

1.2 HVAC System Overview

- UVs located in each classroom are designed to provide ventilation and heat to the room by forcing mixed air past a hot water heating coil and delivering the heated air to the room. The UVs are Nesbitt Syncretizer Model N-1000/ N-1250 and appear to be original to the building. The UVs are controlled via local pneumatic controls.

- H&V-1 and H&V-2 are located in a storage room in the gym/auditorium. Each unit is a Trane Torrivent Model T12 and appears to be original to the building. The H&V unit is designed to provide ventilation and heat to the room by forcing mixed air past a hot water heating coil and delivering the heated air to the room. The unit works in conjunction with a dedicated exhaust fan to maintain room pressurization. The 1962 HVAC drawings indicate that the units were originally intended to serve the cafeteria as well. The H&V units are controlled via local pneumatic controls.
- Both units appear to be in fair to poor condition and are beyond their expected useful life.
    - HV&-1: The outdoor air intake damper was observed to be closed and the heating coil appeared to be excessively dirty.
    - H&V-2: The outdoor air intake damper was observed to be approximately 25% open, but an opening in the ductwork was discovered at the return plenum box. As a result, the TAB contractors were unable to accurately measure the return/exhaust air.
- EFs are installed on the roof of the building and exhaust the common restrooms and classroom toilet rooms. The fans also serve as general exhaust for faculty areas and the classrooms through exhaust grilles located in the closets. The fans are a combination of Greenheck models GB-180-3X, GB-161-4X, GB-121-4X and Dayton Models 48C188. Drawings indicate the fans were installed during the 2005 roof renovation.
- FCUs are located throughout the building. FCUs were observed in the cafeteria/stage, stairwells, entrance vestibules, and classroom lobbies etc. The units do not provide ventilation but are intended to provide heat to the spaces where they are located.

2 EVALUATION

2.1 Code Compliance

In 2023, substitute senate bill 1198 codified ventilation assessments at each school building under jurisdiction of local and regional boards of education. These assessments must be completed by January 1, 2025, and every five years thereafter. Per the requirements of sSB 1198, the assessment included the following inspections and evaluations:

(A) Documenting for maximum filter efficiency (MERV ratings)

(B) Physical measurements of outside air delivery rate at the minimum damper position

(C) Verification of the appropriate condition and operation of ventilation components

(D) Measurement of air distribution through all system inlets and outlets,

(E) Verification of unit operation and that required maintenance has been performed in accordance with the most recent indoor ventilation standards promulgated by the American Society of Heating, Refrigerating and Air-Conditioning Engineers

(F) Verification of control sequences of damper operations

(G) Verification of carbon dioxide sensors does not apply.

(H) Identification of to what extent each school's current ventilation system components, including any existing central or noncentral mechanical ventilation system, are operating in such a manner as to provide appropriate ventilation to the school building in accordance with most recent indoor ventilation standards promulgated by the American Society of Heating, Refrigerating and Air-Conditioning Engineers.

The required supply of outside air into interior occupied spaces is governed by the 2022 Connecticut State Building Code, which adopts the 2021 International Mechanical Code (IMC), and ASHRAE Standard 62.1. This code prescribes the flow rate of outdoor air required for occupied areas based on occupancy classification. When occupancy density is unknown, these documents define the design occupant density for each room classification. The required flow rate in CFM for every occupied space is then calculated based on this value.

It shall be noted that although the occupancy classification is education, the IMC does not distinguish between an office space located within an office building, a school, or any other building classification. This applies to all rooms that are not considered traditional educational rooms such as health care offices, gymnasiums, theaters, and assembly halls.

Some room types do not have an outside air requirement, as can be seen in Table 1. Alternatively, these rooms have exhaust rates that must be met, and are evaluated separately in this report. Refer to the exhaust rate evaluation table in Appendix B for individual room exhaust rate evaluations.

In addition to providing mechanical ventilation to the space, an alternative method approved by the building code allows for air to enter the occupied space naturally through operable windows. The code states that the minimum openable area to the outdoors shall be 4% of the floor area being ventilated. Although this is an acceptable means of providing outdoor air by code, it is not a realistic option during cold weather or hot weather months, as windows will typically be closed. Operable windows are not considered as sources of ventilation in this analysis.

Table 1
Room Type & Occupancy Summary

Room Types	Quantity[1]	Total Area[1] (SF)	Occupancy Rate[2] (People/1000 SF)	Occupancy Ventilation[2] (CFM/person)	Area Ventilation[2] (CFM/SF)	Exhaust Rate[2] (CFM)

[2] Based on 2021 International Mechanical Code

2.2 Field Study Findings and General Observations

F&O performed a walkdown of the school prior to the TAB testing activities and noted room measurements, observable maintenance concerns and general equipment condition. Below is a summary of observations made.

2.2.1 Air Distribution and Outside Air Dampers

A summary of observations includes the following:

- The majority of exhaust grilles were found to be dirty.
- Insulation was not installed on ductwork associated with the H&V units, which can reduce the efficiency of the system. H&V-1 outdoor air damper was found closed, while H&V-2 outdoor air damper was found approximately 25% open.
- The outdoor air louvers associated with the unit ventilators in the classrooms were found to be blanked off. Closed outdoor air dampers and blanked off intake louvers prevent outdoor air from entering the building resulting in unventilated spaces.
- One classroom was found to have been converted from a single space to two separate spaces when compared to the original 1962 drawings. The room was split at the center of the original unit ventilator. We assume that the UV is currently serving both spaces. However, HVAC calculations should be performed and air distribution to the rooms should be designed to provide properly conditioned outdoor air to each side.

2.2.2 Unit Ventilator Units (UV)

A summary of observations includes the following:

- The fresh air intake louvers for the UVs were observed to be blanked off, resulting in the room not getting any outdoor air through the unit.
- As currently configured, the UVs are not providing ventilation as designed or required by code.
- The UVs are in fair to poor condition and are beyond their expected useful life.

2.2.3 Heating and Ventilating Units (H&V)

A summary of observations includes the following:

- A partition wall between the gym/auditorium and the cafeteria is retractable and separates the spaces. When the partition is closed, the cafeteria does not receive outdoor air as designed. See Section 2.3.

- The outdoor air intake damper of H&V-1 was observed to be closed and the heating coil appeared to be excessively dirty.
- The outdoor air intake damper of H&V-2 was observed to be approximately 25% open.
- An opening at the return air plenum was discovered during air testing. This opening allows air to leak into the system, reducing the effectiveness of the system and the accuracy of the air measurements.
- Both H&V units appear to be in fair to poor condition and are operating beyond their expected useful life.

2.2.4 Exhaust Fans

A summary of observations includes the following:

- Most of the exhaust fans measured were found to be running below their design air flow. Please refer to the TAB report in Appendix B for a full list.
- Many of these exhaust fans provide ventilation for the core bathrooms and toilet rooms in the classrooms. According to IMC standards, restrooms require a minimum of 50 cfm of exhaust air per stall or urinal in continuous operation or a minimum of 70 cfm of exhaust air per stall or urinal when operating intermittently.

2.3 Outside Air Flow and Air Change Rates

2.3.1 Airflow Design vs. Measurements

Table 2 and 3 below displays H&V design parameters regarding supply and outside airflows. Design information was obtained from the 1962 as-built drawings. Air flow measurements were performed by Air Balancing Services Co. Ventilation requirements are based on ASHRAE 62.1 as referenced in the state's building code. Note that the measured supply airflows are approximately half of the designed supply airflow of both units.

The H&V units serving the Gym/Auditorium and Cafeteria are operating at approximately 50% of design. H&V-1 has a closed outdoor air damper and does not provide any outdoor air. H&V-2 is supplying approximately 62% of its designed outdoor air at its current operating condition. As such, the outdoor air being supplied to the space is approximately 30% of the designed outdoor air rate. The calculated outdoor air required using current codes is approximately 5% more than the H&V units were initially designed for. An opening in the return air plenum was observed which could impact the accuracy of the air measurements. Appendix A contains the full report provided by Air Balancing Services Co.

Table 2
Design vs. Measured Airflow

H&V	DESIGN AIRFLOW			MEASURED AIRFLOWS		
	SUPPLY CFM	OA CFM (CFM)	DESIGN % OA	SUPPLY CFM	OA CFM	% OA
H&V-1	4500	2130	47%	2063	0	0%
H&V-2	4500	2130	47%	2983	1335	45%

Table 3
Design vs. Calculated Outside Airflow

H&V	DESIGN AIRFLOW			CALCULATED AIRFLOW		
	SUPPLY CFM	OA CFM (CFM)	DESIGN % OA	SUPPLY CFM	OA CFM	% OA
H&V-1	4500	2130	47%	4500	2350	52%
H&V-2	4500	2130	47%	4500	2350	52%

2.3.2 Individual Room Ventilation

Minimum ventilation rates for each room are itemized in Appendix C. As stated previously, the primary source of ventilation in the classrooms is from operable windows. Although the building code allows for ventilation to enter occupied spaces naturally through operable windows, it is not a realistic option during cold weather or hot weather months. For this reason, operable windows will not be considered as a source of ventilation in this analysis. The Unit Ventilators in the classrooms are not providing any outdoor air as the intake louvers are blanked off.

The H&V units serving the Gym/Auditorium and Cafeteria are operating at approximately 50% of design. H&V-1 has a closed outdoor air damper and does not provide any outdoor air. H&V-2 is supplying approximately 62% of its designed outdoor air at its current operating condition. As such, the outdoor air being supplied to the space is approximately 30% of the designed outdoor air rate. It should also be noted that the units are intended to provide ventilation to the cafeteria. The auditorium/gym and cafeteria are separated by a removable partition as previously mentioned in Section 2.2.3. Although some air can reach that space, the wall significantly restricts the flow of air from the auditorium/gym to the cafeteria. While the partition is closed, the cafeteria is not being adequately ventilated based on occupancy requirements.

It has been identified that almost all the rooms within Thomas Hooker Elementary school lack appropriate ventilation to meet the outside air requirements prescribed by the ASHRAE Standard 62 as referenced in the state's building code.

3 Discussion and Recommendations

3.1 General Recommendations to Improve Schools Performance

To preserve the condition and capability of the HVAC equipment serving the building, it is recommended that a maintenance program following ASHRAE 180-2018: *Standard Practice for Inspection and Maintenance of Commercial Building HVAC Systems* be implemented. This standard provides a comprehensive guide, that when followed, can increase the HVAC system's ability to achieve acceptable thermal comfort, energy efficiency and indoor air quality within the building.

Recommissioning of the entire HVAC system should be performed in 3–5-year intervals, to ensure all equipment and control components operate as designed. This service optimizes system performance, increases energy savings, and improves system efficiency.

3.2 Air Distribution and Outdoor Air Dampers

It is recommended that cleaning of the school's entire duct systems be performed by a qualified professional. Cleaning can help improve the quality of the air being circulated throughout the school.

Rebalancing of the supply, return, exhaust, and outside air dampers for each H&V unit is also recommended. Rebalancing should be performed after completion of duct cleaning and adjustments to equipment and all associated dampers.

3.3 Unit Ventilators

Due to the age and condition of the UVs it is recommended that the units be replaced. A full HVAC design should be performed to specify the appropriate equipment replacement to meet current requirements.

It is the client's option to have the UVs tested for current capabilities and correct deficiencies through repair. Testing of the UVs should be performed after outdoor air opening blank offs are removed and dampers are repaired.

3.4 Heating and Ventilating Units

Due to the age and condition of the Heating and Ventilating units, it is recommended that the units be replaced. A full HVAC design should be performed to specify the appropriate equipment replacement to meet current requirements. All associated dampers, ductwork, and accessories should be repaired as required for a complete functioning HVAC system. It is the client's option to have the H&V units tested for current capabilities and correct deficiencies through repair. We also recommend a separate HVAC system be provided to serve the cafeteria.

3.1 Exhaust Fans

All of the exhaust fans were found to be running below their designed airflow rate. F&O recommends the exhaust fans and their associated exhaust registers be re-balanced to provide adequate ventilation according to ASHRAE standards. Exhaust fans that are not operational or incapable of providing adequate ventilation should be repaired or replaced. All exhaust fans should have maintenance performed.

SQ FT	SQUARE FEET
TEMP	TEMPERATURE
TF	THERMAFUSER
TSP	TOTAL STATIC PRESSURE (" WG)
VAV	VARIABLE AIR VOLUME
VEL	VELOCITY IN FEET PER MINUTE
VFD	VARIABLE FREQUENCY DRIVE
W	WIDTH
WEF	WALL EXHAUST FAN
WG	WATER GAUGE
W/	WITH

PROJECT: THOMAS HOOKER ELEMENTARY SCHOOL
VENTILATION VERIFICATION

PROJECT DESCRIPTION: Test, Investigate, Analysis & Adjustments as requested

COMMENT:

1) The outdoor air louvers for the unit ventilators are blanked off.
2) The building is negative .08" WG relative to outdoors.
3) HV-1:
    a) Serving the Gym / Auditorium, we noticed O.A damper appeared to be closed
    b) Hot water coil is excessively dirty
4) HV-2:
    a. Serving the Gym / Auditorium, we noticed O.A damper approximately 25% open.
    b. We noticed on the return box / plenum in the office where it is hanging, there is an open slot pulling air into the unit, this explains the low return grill readings in the gym.

General Notes:

(For Fuller Explanation Of Materials And Workmanship See Specifications)

Allowable Live Loads, (Lbs/ Sq. Ft.)

Allowable Maximum Soil Bearing Pressure 3 Tons/ Sq. Ft.

The Soils Log Shown Is For General Information Only. The Contractor Shall Not Rely Upon This Information In Making His Bid, Since The Log Cannot Show A Fair Representation As To The Balance Of Conditions Nor The Permeability Of The Materials.

All Concrete Shall Have A Minimum Compressive Strength Of [illegible] psi @ 28 Days.

All Elevations Are Based On A Floor Elevation Of [illegible]
(a) Elevations Of Footings Are To Bottom Of Footings. All Footings Shall Rest On Undisturbed Soil.
(b) Elevations Of Steel Beams Are To Tops Of Steel Beams.
(c) Elevations Of Slabs Are To Tops Of Concrete Slabs.

Concrete Coverage Of Reinforcing Steel Shall Be:
3" For Bottoms Of Footings.
2" For Other Concrete In Contact With Soil.
1½" For Concrete Beams, Piers, And Columns Not In Contact With Soil.
3/4" For Slabs.

All Reinforcing Steel Shall Be New Billet Steel Of Intermediate Or Hard Grade Conforming To A.S.T.M. A-305 Revised To Date.

All Welded Wire Fabric For Concrete Reinforcement Shall Conform To A.S.T.M. A-185 Revised To Date. Welded Wire Fabric In Concrete Slabs On Earth Shall Be Placed Approximately 1" From The Top Of The Slab.

All Reinforcing Bars Marked Continuous Shall Lap A Minimum Of 24 Bar Diameters.

All Structural Steel Shall Be In Accordance With A.I.S.C. Type II Construction.

Minimum Connections Except For Girts, Sag Bars, And Bracing Shall Be Designed For A Minimum of 10 Kips For Welded Connections And 7 Kips For Bolted Or Riveted Connections.

All Structural Steel Which Carries Masonry Shall Be Shored By The General Contractor Until Masonry Is All On And Is Safe. This Note Applies Also To Steel Lintels Over 4'-0" M.O. Note Is Not Intended For Beams Carrying Walls Through A Floor System.

All Lintels Shall Have 6" Minimum Bearing.

The General Contractor Shall Coordinate The Dimensions Of The Roof, Floor, And Wall Openings So The Framing Properly Fits The Mechanical Trade Requirements.

GENERAL NOTES

1. AT PROJECT COMPLETION, ALL AREAS WITH-IN CONTRACT LIMITS SHALL BE CLEAN, FREE OF TRASH, CONSTRUCTION MATERIALS + EQUIPMENT.
2. REPLACE OR REPAIR ALL LAWN, PLANTINGS, AND PAVED SURFACES AS REQUIRED WHICH MAY BE DAMAGED BY CONSTRUCTION ACTIVITIES.
3. AT LAWN AREAS DISTURBED, PROVIDE REPAIR AS SHOWN IN DETAIL 1 ON THIS DRAWING.
4. FERTILIZE AT THE RATE OF 1000 LBS/PER ACRE WITH 10-10-10 FERTILIZER. 40% OF THE NITROGEN TO BE A SLOW RELEASE FORM. LIME TO A PH OF 6.5 AT A RATE PF 100 LBS. PER 1000 SF.
5. SEED MIXTURE AS FOLLOWS:
   - 40% KENTUCKY BLUEGRASS
   - 30% CHEWING RED FESCUE
   - 10% PERENNIAL RYEGRASS
6. ROOFING CONTRACTOR SHALL PROVIDE OVERHEAD PROTECTION AS REQUIRED AT ALL DOOR OPENINGS WHILE WORKING ON ROOF WHEN BUILDING IS OCCUPIED.

ME-1

GENERAL SPECIFICATIONS

1.1 GENERAL

A. Architect's General Conditions are a part of this Division. All work shall be done in strict accordance with all applicable Codes and Regulations of local and State Agencies, Owner's insurance underwriter, IRI or FM, local Fire Marshal and utility companies. This Contractor shall bear the cost of all fees, permits, licenses and taxes and any utility company charges in connection with the work. All equipment installed shall be UL listed.

B. Contractor shall allow that work may need to be accomplished under premium time and must be coordinated with the Owner and the Roofing Contractor.

1.2 SCOPE

A. Demolition:
1. Remove all existing roof mounted fans, intake hoods, exhaust hoods, curbs and associated equipment. Coordinate extent of demolition with new work.
2. All materials removed under these divisions and not scheduled for reuse or requested by the Owner, shall be properly and promptly disposed of off site meeting all applicable regulations of local State Agencies.
3. Electrical Contractor shall disconnect mechanical equipment scheduled to be removed. Remove wiring and conduit back to ceiling space below roof. Retain branch circuit for extending to new equipment.

B. New Work:
1. Mechanical Contractor shall furnish and install new rooftop exhaust fans, intake and exhaust hoods, and roof curbs. Coordinate extent of work with Roofing Contractor.
2. Mechanical Contractor shall provide a complete, operational system including start-up by the manufacturer and testing and balancing by a certified firm.
3. Electrical Contractor shall provide new J-Box at building interior and extend new conduit and wiring up to new mechanical equipment and make final connections.

1.3 SHOP DRAWING SUBMITTALS

A. Submit shop drawings on equipment and materials, in sextuplet (6 copies), to the Architect for approval. The Drawings shall include ratings, performance information, operating data and wiring diagrams. The Contractor shall assume full responsibility for work performed or equipment supplied that is not in agreement with approved shop drawings.

B. The following list of items must be submitted by contractor for approval:
1. Rooftop exhaust fans.
2. Rooftop intake and exhaust hoods.
3. Roof curbs.
4. Sheet metal connections/transitions.
5. Damper.
6. Electrical wiring and equipment.

1.4 RECORD DRAWINGS

A. Neatly and accurately record all changes to Contract Documents on record set of drawings furnished by the General Contractor. These record "as-built" drawings shall include locations of specific items as listed in the various specification DIVISIONS. Upon project completion, these record drawings shall be turned over to the Architect.

1.5 DEFINITIONS

A. As used on Contract Drawings, the term "to provide" shall mean "to furnish", install and connect completely in the specified or approved manner the item or material described.

1.6 GUARANTEE

A. All mechanical equipment, materials and workmanship shall have standard warranty against defects in material and workmanship. Failures due to defective or improper materials, equipment, workmanship or design shall be made good, forthwith, by and at the expense of the Contractor, including damage done to areas, materials and other systems resulting from such failures. Guarantee period shall extend for one year from the Date of Acceptance.

1.7 INSPECTION

A. Contract Drawings are diagrammatic and do NOT show every required fitting, etc. The Contractors shall examine the architectural and MEP Drawing and Specifications to determine the scope of work and familiarize themselves with existing site conditions prior to submitting a bid, and shall include all equipment and accessories necessary for complete and operational systems.

B. If so directed by the Architect or Engineer, the Contractor shall, without extra charge, make reasonable modifications in the layout to prevent conflict with those of other trades and for proper installation of work. The Contractor shall coordinate locations of equipment with all trades before starting construction. Any modification to the equipment layout required for installation shall be performed at no additional cost to the Owner.

1.8 WORKMANSHIP

A. Equipment and materials shall be new, of first quality, selected and arranged to fit properly into spaces indicated. Install equipment and materials in accordance with manufacturer's recommendations.

1.9 COORDINATION WITH OWNER

A. Work shall be scheduled with the Owner. Interruptions in Owner's or Faculty's access to the site shall be subject to Owner limitations of date and duration.

1.10 OPERATION OF SERVICES AND UTILITIES

A. Shutdown of existing services and utilities shall, without exception, be coordinated with the proper utility and with the Owner as to date, time of day, and duration before any service is interrupted. Notify the Owner of estimated duration of shutdown period at least ten days in advance of proposed shutdown.

1.11 PROTECTION

A. Close open ends of work with temporary covers or plugs during construction to prevent entry of foreign material. Protect existing property, equipment and finishes from damage. Repair, to original condition, existing property that has been damaged during execution of the work.

1.12 CLEANING

A. Work site must be kept clean. Rubbish, debris and leftover or excess materials shall be removed daily.

1.13 LUBRICATION

A. No equipment shall be operated for temporary service or testing without proper lubrication. Items requiring lubrication shall be left freshly and fully lubricated at time of substantial completion. Furnish Owner with one complete new set of any special lubrication devices required for servicing, e.g., grease guns, fittings and adapters.

1.14 PAINTING

A. Equipment and materials shall have standard manufacturer's finish except where otherwise noted.

1.15 CUTTING AND PATCHING

A. Cutting and patching to be performed by General Contractor. Painting of finished surfaces after patching shall be as specified by Architect or shall match adjacent finishes.

1.16 WATERPROOFING

A. Provide necessary sleeves, caulking and flashing required to make openings waterproof.

1.17 BASES AND SUPPORTS

A. Provide necessary supports, pads, bases and piers for equipment. Equipment shall be securely attached to building structure in acceptable manner in compliance with BOCA 1113 Seismic. Attachments shall be of strong and durable nature, as determined by the Owner.

1.18 TESTS

A. Each piece of equipment, including motors and controls, shall be operated continuously for minimum one-hour test. Correct all defects appearing during tests, and repeat tests until no defects are disclosed. Final tests shall be made in the Owner's presence.

1.19 SYSTEMS OPERATION AND MAINTENANCE

A. Upon completion of the work and at a time designated by the Engineer, the Contractor shall furnish (5) instruction manuals including data, warranties, etc., and shall instruct the Owner or his representative as to the arrangement, location and operation of all equipment and systems furnished and installed under the Mechanical and Electrical Contract.

1.20 FIELD MEASUREMENT

A. The HVAC Contractor shall verify in the field all measurements necessary for the work.

1.21 PERMITS, LAWS, ORDINANCES, CODES AND STANDARDS

A. Obtain and pay for permits, inspections, licenses and certificates required. Work of this Contract shall meet State Building Code, State Fire Safety Code and other laws, rules and regulations of local, State and Federal authorities; National Fire Protection Association #13, 1998 Edition; National Fire Protection Association #90A and #90B, National Fire Protection Association #96, Latest Edition; International Mechanical Code, 1996 Edition and International Plumbing Code, 1997 Edition; National Electrical Code, 1999 Edition. Equipment, materials and components listed UL Product Directories, shall bear UL labels.

1.22 INSURANCE

A. Furnish insurance certificates required by the Owner.

1.23 LOAD BALANCE

A. The Electrical Contractor shall balance the loads on the three phases in the electrical panelboard in which he does work insofar as physically possible, and report each panel loading to the Engineer.

1.24 GENERAL WIRING TESTS

A. At the time of final inspection and test, all wiring and connections throughout the renovation areas must be completed, devices and equipment properly operating, and power and control wiring clearly identified with approved tags ready for acceptance. Each system shall test free from short circuit and grounds.

1.25 OPERATIONAL TESTS

A. Each piece of electrical equipment, including motors and controls, shall be operated continuously for minimum test period of one hour.

B. Demonstrate by operating equipment that circuits and devices are in good operating condition. Each item of control equipment shall be operated minimum of five times. Demonstration shall be performed after wiring tests.

1.26 MECHANICAL SYSTEM ADJUSTMENT AND TESTING

A. Be present during adjustment period and final testing of mechanical systems. Take readings necessary to ensure that electrical systems are operating properly.

B. Take ampere readings with true RMS reading summer ammeter at each electrical component to determine proper operation.

C. Record readings and submit them in triplicate to the Engineer for review.

1.27 LABELING

A. Label all new disconnects, starters, and motors in a manner acceptable to the Engineer. Provide updated panel schedules in all panelboards within the scope of work.

HVAC SPECIFICATIONS

2.1 DUCTWORK

A. All ductwork and accessories shall be constructed, fabricated and installed in accordance with the latest SMACNA Standards manuals for low pressure ducts, fire damper installations and flexible ductwork.

B. All supply and outside air ventilation systems ductwork shall be galvanized sheet metal, two (2") inch static pressure classification, Seal "C".

2.2 AUTOMATIC TEMPERATURE CONTROLS

A. Provide reconnection and verification of any and all temperature control devices encountered.

2.3 CENTRIFUGAL ROOF VENTILATORS

A. Description: Belt-driven or direct-driven centrifugal fans consisting of housing, wheel, fan, shaft, bearings, motor and disconnect switch, drive assembly, curb base, and accessories

B. Housing: Removable, spun aluminum, dome top and outlet baffle; square, one-piece, aluminum base with venturi inlet cone.

C. Fan Wheels: Aluminum hub and wheel with backward-inclined blades.

D. Belt-Driven Drive Assembly: Resiliently mounted to housing, with the following features:
1. Fan Shaft: Turned, ground, and polished steel; keyed to wheel hub.
2. Shaft Bearings: Permanently lubricated, permanently sealed, self-aligning ball bearings.
3. Pulleys: Cast-iron, adjustable-pitch motor pulley.
4. Fan and motor isolated from exhaust airstream.

E. Accessories:
1. Variable-Speed Controller: On direct drive fans only, provide and wire solid-state control to reduce speed from 100 percent to less than 50 percent.
2. Disconnect Switch: Nonfusible type, with thermal-overload protection mounted inside fan housing, factory wired through an internal aluminum conduit.
3. Bird Screens: Removable, 1/2-inch (13-mm) mesh, aluminum or brass wire.
4. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.

F. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch- (40-mm-) thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch (40-mm) wood nailer. Size as required to suit roof opening and fan base.
1. Overall Height: 24 inches, coordinate height with roofing insulation thickness.

ELECTRICAL SPECIFICATIONS

2.4 WIRE, CABLE AND RACEWAYS

A. Rigid galvanized steel conduit (RGS) shall be used for all exterior wiring and where subject to dampness, except as noted below or as specifically noted on the Drawings.

B. Electrical Metallic Tubing (EMT) shall be used for feeders run above ground in dry areas, and all exposed branch circuit wiring.

C. Flexible Metallic Conduit (FMC) or liquid-tight flexible metallic conduit (LFMC) shall be used for connections to vibrating equipment and furniture partitions.
1. Greyfan Type LA liquid-tight flexible metal conduit (LFMC) shall be used for final connections to vibrating equipment.

D. Minimum sizes shall be as follows:
1. Conduit and EMT: 3/4" unless otherwise noted.
2. Flexible Metal Conduit: 1/2".

E. Wire #10 and smaller shall be solid conductor with THW/THHN insulation. Minimum size wire for power circuits shall be #12 AWG. The Contractor shall include an individual code sized green insulated ground conductor for all circuits; the use of the conduit system or cable covering as the sole means of grounding will not be permitted.

F. All conduits and wiring shall be run concealed inside walls where possible. Exposed conduits where allowed shall be run neatly in lines parallel or perpendicular to building walls.

G. All splices for #10 or smaller shall be made with "Scotchlok" spring connectors or equal. Splices for #8 or larger shall be made with UL approved compression connectors.

2.5 SAFETY SWITCHES

A. Safety switches shall be 600 VAC, heavy-duty type in NEMA enclosures suitable for the environment in which they shall be installed. Switches shall be Square D, General Electric or Cutler-Hammer equivalent to the following Square D types:
1. Fused disconnect 2- and 3-pole: "Type H".
2. Non-fused disconnect switches: "Type HU".
3. Fused or non-fused, raintight (HP) disconnect switches in NEMA 3R enclosure: "Type H-R" and/or "Type HU-R".

2.6 FUSES

A. Fuses for circuit protection shall be UL listed, non-renewable, low peak, dual-element, time delay fuses, Bussman Type FRN-RK (250 Volt) or FRS-RK (460 Volt) UL Class RK5 or approved equal.

2.7 OUTLET AND JUNCTION BOXES

A. Junction boxes shall be sized in accordance with Code requirements.

B. Junction and outlet boxes where exposed to the weather and wet locations shall be threaded hub type and provided with watertight screw-on covers and gaskets.
